

LOG & LUMBER TAGS

Our sequentially numbered and bar coded tags are used in the forest products industry to track, sort, control inventory and identify single logs, log bundles and finished goods. They are also used for accurate log identification when grading logs.

Our tags are designed to be used in harsh outdoor environments, to endure fierce storms, long periods under water, strong winds, ultraviolet rays and/or extremely high kiln temperatures.

Our tags are produced to meet and/or exceed performance under all the outdoor elements. They can be color-coded to visually identify from a distance, specific characteristics of wood products and come with multiple stubs to meet individual requirements. They are available in a variety of stocks and can be printed with different kinds of inks. "Digestible" tags, which resist weather and abrasion and dissolve during the Kraft process without leaving residue, are also available.

Universal Tag offers decades of experience in tag design, materials, specialized converting and printing, and comprehensive R & D, which assure the user that their tags always represent the latest in barcode technology.

When it comes to ways to meet your automatic identification needs, Universal Tag is the leader in custom tags and labels.
